

AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

LISTING OF CLAIMS:

30-57. (canceled)

58. (new) A method for the detection and identification of an object provided with identification means and wireless transmission means, the object being located close to one receiver module among a plurality of receiver modules, the method comprising the steps of:

electromagnetically coupling the wireless transmission means of the object with a first of a plurality of fixed antennae associated with the receiver module; and

switching, in an analogue manner, between each of the fixed antennae and a secondary fixed antenna common to all of the fixed antennae such that the common secondary fixed antenna is electrically coupled to each of the fixed antennae of each receiver module in succession,

wherein the common secondary fixed antenna is electromagnetically coupled to a primary fixed antenna connected to a reader module configured to read identification data originating from the identification means.

59. (new) The method according to claim 58, further comprising the step of:

transmitting information from the reader module to the identification means of a previously detected and identified object.

60. (new) The method according to claim 58, wherein each electromagnetic coupling induces a supply of electrical energy to the identification means of the object by inductive coupling, the electrical energy originating from a power supply module connected to the primary fixed antenna.

62. (new) The method according to claim 60, wherein each electromagnetic coupling induces a transmission of identification data transmitted by the identification means of the object towards the reader module.

63. (new) The method according to claim 58, further comprising the steps of:

processing the identification data originating from the identification means of an object; and

selectively controlling a blocking/locking means associated with the receiver module when the antenna of the receiver module is electromagnetically coupled to the wireless transmission means of the object.

64. (new) The method according to claim 58,  
wherein the electromagnetic coupling between the  
secondary fixed antenna and the primary fixed antenna of the  
reader module is permanent, and

wherein the secondary fixed antenna is connected to the  
primary fixed antenna via a plurality of link sections in  
cascade, each link section comprising an electrical link between  
a secondary intermediate antenna of the link section and a  
primary intermediate antenna of the link section and an  
electromagnetic coupling between the primary intermediate antenna  
and a secondary intermediate antenna of a following link section.

65. (new) A device for the detection and  
identification of an object provided with identification means  
and wireless transmission means, the object being present close  
to one receiver module among a plurality of receiver modules, the  
device comprising:

a plurality of fixed antennae each associated with one  
receiver module among the plurality of receiver modules;

analogue switching means for selectively electrically  
connecting one antenna among the plurality of fixed antennae to a  
common secondary fixed antenna;

a primary fixed antenna electromagnetically coupled to  
a secondary fixed antenna; and

a common reader module configured to read identification data originating from the identification means, the reader module being connected to the primary fixed antenna.

66. (new) The device according to claim 65, wherein the common reader module is further configured to transmit information to an object close to a receiver module.

67. (new) The device according to claim 65, wherein the selective connection means is configured to connect each fixed antenna of the module to the secondary fixed antenna in a sequence.

68. (new) The device according to claim 65, further comprising:

a power supply module connected to the primary fixed antenna, the power supply module configured to transmit electrical energy to the identification means of the object, the wireless transmission means the object being inductively coupled to a fixed antenna of a receiver module via the electromagnetic coupling between the primary fixed antenna and the secondary antenna and the electromagnetic coupling between the fixed antenna of the receiver module and the wireless transmission means.

69. (new) The device according to claim 67, wherein the common secondary antenna is electromagnetically coupled to a primary intermediate antenna, the primary intermediate antenna being electrically connected to a secondary intermediate antenna electromagnetically coupled to the primary fixed antenna of the reader module.

70. (new) The device according to claim 69, further comprising:

a plurality of pairs of intermediate antennae each constituted by a primary intermediate antenna and a secondary intermediate antenna which are electrically connected.

71. (new) Equipment for securely storing a plurality of objects each provided with identification means and wireless transmission means, comprising:

a group of modules each configured to receive one object among the plurality of objects, each receiver module comprising means for selectively blocking/locking an object;

means for controlling the selective blocking/locking means;

a plurality of fixed antennae each associated with one receiver module among the plurality of receiver modules;

means for selectively electrically connecting one antenna among the plurality of fixed antennae to a common secondary fixed antenna;

a primary fixed antenna electromagnetically coupled to the secondary fixed antenna; and

a common reader module configured to read identification data originating from the identification means, the reader module being connected to the primary fixed antenna and cooperating with the control means.

72. (new) Equipment according to claim 71, further comprising:

electrical supplying means connected to the primary fixed antenna configured to supply power to the identification means of the object, the wireless transmission means the object being inductively coupled to one antenna of one of the receiver modules of the equipment.

73. (new) Equipment according to claim 71, wherein each receiver module comprises,

a housing arranged to receive a mechanical coupling part of a key or a key ring, the coupling part including the wireless transmission means,

a fixed antenna of the module arranged close to the housing to produce an electromagnetic coupling between the fixed

antenna and the wireless transmission means of the object, the mechanical coupling part of the object being engaged in the receiver housing, and

an electromagnet comprising a mobile part configured to engage in the mechanical coupling part.

74. (new) Equipment according to claim 73, wherein the mechanical coupling part has one end comprised of a substantially cylindrical cavity, the wireless transmission means of the object, and the identification means of the object.

75. (new) Equipment according to claim 73, wherein the mechanical coupling part is comprised of a first part with a head including the wireless transmission means and the identification means, an indented part for receiving the mobile part of a blocking/locking electromagnet, a non-reversible mechanical coupling part, and a second part with at least one housing for receiving the non-reversible mechanical coupling part of the first part.

76. (new) Equipment according to claim 71, wherein the group of modules is configured to store in a secure manner weapons provided with identification means and wireless transmission means.

77. (new) The method according to claim 58, wherein the object is comprised of an identification means and wireless transmission means configured to exchange information by proximity radiofrequency with the receiver module.

78. (new) The method according to claim 77, wherein a means for mechanical coupling with selective blocking/locking means is arranged in the receiver module.

79. (new) Method according to claim 58, wherein the wireless transmission means is configured for the management of keys or bunches of keys in a lockable cabinet.

80. (new) Method according to claim 58, wherein the wireless transmission means is configured for the management of documents in a filing cabinet.

81. (new) Method according to claim 58, wherein the wireless transmission means is configured for the management of weapons in a weapons locker.

82. (new) Method according to claim 58, wherein the wireless transmission means is configured for the identification of a vehicle in a parking space.

83. (new) The method according to claim 58, wherein the fixed reception antenna is associated with a parking space, and is electrically connected to the primary antenna configured to be common to all of parking spaces of a parking area and electromagnetically coupled to an antenna of a common reader module, and the identification means and the wireless transmission means are arranged as an identifier module in a vehicle in order to be electromagnetically coupled to the fixed reception antenna of the parking space when the vehicle is parked in the parking space.

84. (new) Systems according to claim 83, wherein the identifier module of the vehicle is included in one and/or more of the number plates of the vehicle.

85. (new) System according to claim 84, wherein the identifier module of the vehicle is provided in the form of a radiofrequency tag (RF tag).
